Incorporating Solar into Agricultural Landscapes – Workshop for Virginia Farmers

March 2022
Who is CCSA?

The Coalition for Community Solar Access is the business voice for community solar in the United States.

- Our mission is to expand customer choice & access to solar for all households & businesses through local, clean, and affordable community solar.
- We work with customers, utilities, local stakeholders, and policymakers to develop and implement policies and best practices that ensure community solar programs provide a win, win, win for all, starting with the customer.

Shared Solar (Community Solar) Overview
What is Shared Solar (AKA - Community Solar)?

- Projects are typically 2-5 MW and connected to the distribution system and are statutorily limited to 5 MW.
- Locally sited projects in and around your community
- Multiple subscribers receive the energy output from a single solar array
- Participants receive a credit on their electric utility bill for portion of power produced
How does it work?

Electric Utility

Community Solar Project

Electricity

Community Solar Bill Credits

Community Solar Subscribers

Upfront or Ongoing Participation Payment

Project Development/Maintenance

Community Solar Developer
Benefits of Shared Solar?

**LOWER ENERGY BILLS.**
Locally produced solar provides homeowners, renters and businesses equal access to the cost-saving benefits of solar energy.

**LOCAL JOB CREATION & ECONOMIC IMPACT.**
Local energy creates good-paying jobs in communities across the United States. Local solar also provides economic opportunities for farmers through land leases and provides significant tax revenue to local municipalities, which in turn can fund local public services and infrastructure improvement projects.

**REDUCED GRID COSTS.**
By generating energy closer to the consumer, local solar reduces demand for costly, large-scale utility and distribution infrastructure.

**A MORE RESILIENT GRID.**
Local solar energy, especially when paired with battery storage, will make the electric grid more resilient to weather, climate, and large-scale disruptions. Instead of relying on giant power plants and the poles and wires to transmit power hundreds of miles, a distributed grid of local solar facilities can even out the electric load and reduce outages.

**CONTINUED INNOVATION.**
Expanding the market creates opportunities for competition, innovation and equitable access to the benefits of renewable energy. This will lead to more efficient products, faster deployment of renewables, increased savings for customers and greater economic benefits, especially for low- and moderate-income communities.

**MORE EQUITABLE PARTICIPATION.**
Everyone with an electric bill can directly participate in and benefit from rooftop and community solar. With intentional action including policy and programming support, local energy includes low-wealth communities who have been most impacted by pollution from traditional power plants.
National Experience with Shared Solar

• **By the Numbers**
  - NREL/SEIA estimate there are 4,600 megawatts installed through 2021
  - At least 41 states (plus DC) with at least one project online
  - At least 19 states (and DC) with state-enabling policies

• **Shapes & Sizes**
  - Shared Solar is also referred to as Community Solar, Community Distributed Generation, Solar Gardens, Shared Renewables, other?
  - Programs (and projects) can be utility-led, third-party led, community/nonprofit led, hybrids, other?

Shared Solar in Virginia
Shared Solar Programs in Virginia

• In Virginia, there are two programs associated with Shared Solar:
  • Shared Solar Program; and
  • Multi-Family Shared Solar Program

• These programs were enabled through legislation and regulations established in 2020 and are now being refined in implementation processes before launching.
  • Shared Solar Program – Subscriber Organization and Project Registration open on July 1, 2020, however actual customer enrollment cannot begin until Dominion develops a customer information platform, or by July 1, 2023 (whichever comes first).

• Note that these should not be confused with Virginia’s Community Solar Pilot program, which legislation established as a utility-led program in Dominion and APCo territories, or with programs established by electric cooperatives.
  • The Shared Solar Programs will be available to third-party led and community-led or other projects
  • Electric cooperatives in Virginia have the ability to establish community solar programs in their territory.
Shared Solar - Virginia Program Basics

• **Territory** – Dominion Energy (Virginia)

• **Program size** – 150 MW, which is expanded by additional 50 MW (200 MW total) upon satisfying the initial low-income participation requirement (30% of capacity).

• **Project requirements** – A solar facility (or co-located facilities) up to 5,000 kW, on any single parcel of land, and connected to the distribution system.

• **Participant requirements** – At least 40% of project capacity subscribed by customers with subscriptions of 25 kW or less; and at least 30% comprised of low-income customers

• **Economics** –
  
  ○ Minimum bill determined by the Commission (low-income are exempt)
  
  ○ Applicable bill credit rate is a $/kWh rate calculated annually by dividing revenues (to the class) by sales (measured in kilowatt-hours), i.e., retail rate
Shared Solar in APCo and Co-op territories?

- The Co-ops and solar industry have been in discussions regarding the potential for shared solar in those territories.

- **SB 659** – originally proposed creation of shared solar in Phase I utility territories (e.g., APCo and Old Dominion).

- **SB 660** – originally proposed creation of shared solar in electric cooperative territories.

- *These bills have been essentially combined and turned into proposed stakeholder workgroups to evaluate shared solar programs in APCo and co-op territories – and to produce a report summarizing the findings by Nov. 30, 2022.*
Shared Solar Project Siting 101
Considerations for siting projects:

1. **Accessibility**: Close access to public roads for utilities, construction crews, and maintenance providers.
2. **Location**: Proximity to utility infrastructure to minimize costs.
3. **Open and clear space**: Ensures minimal shading from trees or crops.
4. **Contiguous**: Rectangular or square parcels with no streams, wetlands, or easements running across.
5. **Size**: One megawatt of solar needs 5-10 acres of land. E.g., 5-megawatt project will require 20-50 acres of land.
6. **Topography**: Less than a 15-degree slope, and ideally faces south.
Benefits to landowners / farmers

Revenue and Planning
- Diversification strategy
- Stable/competitive revenue stream (~$800-$2000 per acre/year)
- Buffers risk associated with fluctuating commodity prices and other uncertainties

Keep Land Local
- Create value on underperforming land
- Minimal impacts
- Avoid selling land to more intrusive forms of development (strip mall, subdivision, etc.)
- Helps keep land in family for generations
- Help power local communities with renewable energy
